AI Generalist, Design

Company: Ather Energy Limited
Location: Bangalore, India
Duration: 6 Months
Type: Full-time Paid Internship
Department: Design

About Us:
Ather Energy Limited is a pioneer in the Indian electric vehicle (EV) market, revolutionizing urban commuting with intelligent, high-performance scooters. Our Industrial Design team is at the forefront of shaping the future of mobility, creating visionary concepts and user experiences that blend cutting-edge technology with elegant aesthetics. We are passionate about integrating advanced tools and methodologies to enhance our creative process and deliver unparalleled products.

The Opportunity:
Are you a curious and driven individual passionate about the intersection of Artificial Intelligence and creative design? We are seeking a proactive and explorative AI Generalist Intern to join our Industrial Design team in Bangalore. This role is not about designing vehicles — it's about designing *for the designers*. You will identify the friction points, bottlenecks, and repetitive tasks that slow down our Industrial Design team, and build simple, AI-powered tools and workflows that make their process frictionless, from the first concept to final execution. You will play a pivotal role in shaping how our design team works.

What You Will Do:
As an AI Generalist Intern, you will be instrumental in identifying problems in our design team's workflow and building solutions that make those workflows smoother. Your responsibilities will include:

- **Problem Identification:** Observe and talk to designers across Industrial Design, Vehicle Design, UI/UX, and CMF to uncover friction points, bottlenecks, and repetitive tasks in their day-to-day process.
- **AI Tool Exploration & Testing:** Research, identify, and rigorously test emerging AI tools and platforms that could solve these problems (e.g., generative design software, advanced rendering engines, AI-powered ideation tools).
- **Solution Design & Tool Building:** Design and build simple, frictionless tools, scripts, or workflows — AI-powered where it helps — that solve the problems you've identified and make the path from concept to execution easier for designers.
- **Workflow Integration:** Develop and propose streamlined workflows for integrating selected AI tools into existing design processes, from initial ideation to final visualization.
- **Process Documentation:** Create clear and comprehensive documentation, tutorials, and best practices so designers can adopt these tools easily.

- **Data-Driven Insights:** Assist in collecting and analyzing data about how designers work to uncover insights and inform which problems to solve next.
- **Collaboration:** Work closely with industrial designers, engineers, and IT to understand their needs and challenges, ensuring the tools you build are practical and genuinely used.
- **Presentation:** Regularly present findings, progress, and recommendations to the design team and stakeholders.

Learning Objectives:
This internship offers a hands-on learning experience where you will:

- Develop a deep understanding of the problem and come up with solutions to make things frictionless for designers to process from concept to execution.
- Become proficient in identifying, evaluating, and integrating advanced AI technologies into creative workflows.
- Enhance your critical thinking and problem-solving skills by optimizing complex design challenges with technological solutions.
- Cultivate an explorative and adaptive mindset, continuously seeking innovative ways to leverage AI for efficiency and creativity.
- Build a strong portfolio demonstrating your expertise in AI-driven design integration.

Who You Are (Qualifications & Skills):
We are looking for a highly motivated individual with a blend of design sensibility and technological aptitude.

- Currently pursuing a Bachelor's or Master's degree in Engineering with a strong development focus and with an acute interest in design.
- **Curiosity and Proactiveness:** A strong desire to explore, experiment, and learn about new technologies, especially AI.
- **Problem-Solving Skills:** Ability to identify the real problem behind a designer's complaint and propose simple, practical, technology-driven solutions.
- **Communication:** Excellent verbal and written communication skills, with the ability to explain technical concepts to non-technical audiences and articulate design thinking.
- **Collaboration:** Ability to work effectively in a team environment.
- **Programming Proficiency:** Working knowledge of programming languages (e.g., Python, JavaScript) to build, customize, or script tools and workflows — basic scripting ability is a strong plus even without a formal CS background.
- **Application Deployment:** Familiarity with deploying tools or applications (e.g., web apps, prototypes, internal utilities) so the solutions you build are actually accessible and usable by designers.
- **Portfolio:** A portfolio demonstrating any exploration into AI, computational design, or advanced visualization is a plus.
